

ExxonMobil Australia's response to COVID-19

ExxonMobil Australia's operations supply essential energy that millions of Australians rely on every day.

Thermal screening is conducted for anyone wishing to enter an ExxonMobil Australia workplace.

Our oil and gas production operations in Gippsland are the largest single supplier of gas to the Australian domestic market. In Melbourne's west, our Altona refinery produces half of Victoria's refined fuel needs while our fuel distribution terminals supply essential fuel across the country.

Changes to work environments and practices have been made to enable social distancing.

Maintaining our operations is essential to ensure we can continue to supply the energy Australians need.

Our social responsibility to keep operating through COVID-19

During this unprecedented challenge we're focused on keeping our people safe and healthy and maintaining our operations so that we can continue to supply the energy Australians need.

Our operations are helping essential businesses and service providers like hospitals, supermarkets and other utilities to keep running, keeping the lights on and heaters working in homes, and ensuring logistics wheels can keep turning to transport essential products across Australia.

We have implemented stringent hygiene and increased cleaning at all our workplaces.

How we are responding to keep our people safe

ExxonMobil Australia is implementing many measures across all of our operations in an endeavor to make sure that our workplaces are some of the safest places for our people to be. This includes a number of steps to support physical distancing across all of our sites such as:

- Reducing work place density by instructing employees to work remotely wherever possible, scheduling workplace attendance where it is required and reviewing work plans to focus on essential operations
- Strictly limiting the people allowed to attend our critical sites to essential personnel only
- Reconfiguring office layouts as well as operation and control room layouts.

We have also implemented stringent cleaning and increased hygiene practices as well as conducting mandatory screening, including a temperature check, of every person that needs to enter one of our workplaces.

Measures to reduce workplace density and support physical distancing are in place across all of our sites.

Maintaining physical distancing on our Bass Strait offshore platforms poses some unique challenges

In order to ensure we can maintain vital gas supplies from our offshore platforms, we have implemented a complex regime that has been called "islanding", in addition to the other measures implemented across all our sites.

Islanding starts with enhanced screening of all offshore passengers before they board flights to travel offshore, including temperature checks. New screens in the aircraft keep the pilots separated from their passengers and schedules are being amended to reduce the number of platforms visited during each flight.

The purpose of the islanding is to keep teams from each platform separated from each other, and other workers, as much as possible.

Keeping our offshore workers safe poses some unique challenges. Controlling the seats used at our heliport helps workers maintain physical distancing.
